

Read the clues and do the puzzle

ACROSS

2. It lives in Australia. It is a mammal. It has a pocket on its body and it carries its baby in this pocket
4. It is a mammal. It only eats bamboo.
6. It lives on land. It has a trunk. It is the heaviest land animal.
7. It is the fastest land animal.
8. It is a carnivore. It lives on land. It has a mane. It is a mammal.

DOWN

1. It has a long tongue. It is a reptile. It can be poisonous.
3. It is a bird. It has a beak. It is a carnivore.
5. It is a mammal. It lives on land. It has stripes on its body.
7. It has no legs. It can live both on land and in water. It has sharp teeth.
9. It is a bird. It can talk. It has colorful feathers.
10. It has a long neck. It is a herbivore.
11. It is a carnivore. It lives in the sea. It is the largest animal.

Categorize the animals

lion - eagle - snake -
elephant - crocodile - bear
butterfly - tiger - penguin
lizard - kangaroo - bee
dolphin - owl - frog
zebra - ant - seagull
giraffe - parrot

Reptiles

Insects

Birds

Mammals

Write parts of the animals

Feathers - Beak - Trunk
Wings - Tail - Horns

Read the text and do the exercises

Seagulls are wild sea animals and they are birds. They usually live near the sea, on beaches, and around ports. Some seagulls can also live in cities.

They have two wings, two legs, a beak, feathers, and two eyes. Their wings help them fly, and their beak helps them catch food.

Seagulls usually eat fish, small sea animals like crabs, and sometimes food left from people. They are omnivores, so they can eat both animals and plants. A seagull can weigh about 0.4–1 kilogram and live for about 10–15 years.

Seagulls are usually white and grey, and they make loud sounds, especially when they are hungry. They can fly very well and often fly over the sea to find food. Seagulls are strong and clever birds, and they can adapt to many places.

Pandas are mammals and they are one of the most famous wild animals in the world. They live mainly in China, in mountainous bamboo forests that are cool and rainy. This habitat gives them a quiet and safe place to eat, sleep, and hide from danger.

Pandas have a very special diet. They eat mostly bamboo, but they sometimes eat fruits, small plants, and eggs. Because bamboo is not very rich in energy, pandas spend many hours a day eating. An adult panda can eat up to 20 kilograms of bamboo every day.

Pandas have black and white fur, a round body, strong jaws, big paws, and a short tail. They are usually calm, quiet, and slow-moving animals. Even though they look heavy, pandas are good climbers and sometimes rest on tree branches.

Pandas usually live for about 20 years in the wild, and they can live even longer in zoos. An adult panda is about 120-180 centimeters long and weighs around 100-150 kilograms. Baby pandas are very small at birth but grow quickly in their first year.

Pandas are gentle animals, and many people love them because of their cute appearance and peaceful nature
